

Self-Introduction:

Hello, my name is Adarsh Sharma, and I am a passionate Frontend Developer with 4 years of experience. Currently, I am working at Tata Consultancy Services (TCS) as a Systems Engineer. In my role, I focus on React development for applications in the life sciences domain. In addition to this, I have also worked in the travel domain. Prior to this, I worked at TCZ as an Associate Technology, focusing on the automotive domain, and before that, I worked at Bella Vita Organic as a Frontend Developer in the natural wellness and organic products domain.

Some of my achievements include:

- I received the Contextual Master Award for my work on web applications in the life sciences domain.
- I earned an A band rating for the 2024–25 financial year for my dedication and consistent work.
- I received a Pat-on-the-back from the client for my contribution to frontend development, along with appreciation emails and an award with a certificate during a client visit.

Describe your last project and your role in it:

In my current project, we're working on three applications. Two of them are used by healthcare professionals (HCPs) across multiple countries to collect digital consent forms from doctors. The third is an internal tool used by the client's teams to manage and analyze the data collected from the other two apps.

We follow the Agile methodology with 2-week sprints. Before each sprint, we conduct backlog refinement sessions to review upcoming tickets, clarify requirements, and provide estimations. This helps us plan effectively and stay aligned on sprint goals.

Once the sprint begins, we move through the typical phases of design, development, testing, and deployment. I contribute by developing and maintaining reusable React components, integrating APIs, and ensuring the UI is accessible, responsive, and aligned with our design system. I work closely with QA for testing, backend teams for API integration, and designers for UI consistency.

At the end of each sprint, we conduct sprint reviews where we showcase completed stories to stakeholders. Alongside regular sprint tasks, I also handle bug fixes, critical hotfixes, and support parallel feature development depending on project priorities.

How do you handle conflicts in a team:

I stay calm and listen to everyone. I try to understand both sides and find a solution that works for all. I believe clear and respectful communication is the key.

Can you tell me about a challenge you faced in your current project and how you handled it?

We had a unique requirement where we needed to persist form data, tab states, and navigation info across the app—even after a page refresh. It was a new use case for the entire team, so I took the initiative to challenge myself and lead the solution.

I broke the requirement into smaller subtasks—handling state persistence using `localStorage` and context APIs, ensuring data consistency, and applying it across different modules. I also handled testing and completed the implementation before the sprint review. It was well received by the stakeholders and added real value to the user experience.

How do you ensure quality in your code and the overall product delivery:

I ensure code quality through a combination of practices and tools. I follow proper PR checks with peer reviews, maintain consistent coding standards using ESLint and Prettier, and use SonarQube to track code smells, coverage, and technical debt. We've also set up Husky to enforce pre-commit hooks, so code is linted and tested before it's even pushed. These steps help maintain a clean, maintainable codebase and reduce bugs in production.

How do you collaborate with cross-functional teams—like designers, backend developers, or QA—in your current project?

I regularly collaborate with designers using Figma to clarify UI behavior and edge cases early on. I work closely with backend developers to define and test API contracts, often using tools like Postman or Swagger. I also stay in sync with QA to plan validations and reduce last-minute surprises. I believe in shared ownership—everyone contributes to delivering a high-quality product, not just their individual piece.

How do you handle last-minute changes or scope creep during a sprint?

If there's a last-minute change during the sprint, I first assess whether it's a breaking change or if it impacts any existing functionality. If it's safe and critical, we incorporate it carefully and ensure a complete sanity check—both manually and through automation where possible. Only after thorough validation do we move forward with deployment. I also communicate the impact with the team and PO so everyone's aligned."

💡 Bonus (if time permits):

"If it's a major change, I recommend moving it to the next sprint unless it's a blocker. I believe in balancing agility with stability

What are some mistakes you've made, and what did you learn:

I once took on too many tasks and missed some deadlines. I learned to prioritize and ask for help when needed. Now, I divide work into smaller steps and manage my workload better, which helps me work faster and deliver better results

What does ownership mean to you in a software project:

To me, ownership means taking full responsibility for the tasks assigned to me—and also supporting my team wherever needed. It's not just about writing code, but ensuring that the work is delivered on time, tested properly, and adds value. If I see a blocker or a teammate struggling, I step in to help because ultimately, we're accountable as a team.

Why should we hire you:

You should hire me because I have 4 years of experience in frontend development, specializing in React, and I've worked in multiple domains like life sciences, travel, and automotive. I'm passionate about creating high-quality applications and always looking to improve my skills. I'm confident I can bring value to your team with my technical expertise and strong problem-solving abilities.

Why do you want to change your company:

I've had great opportunities to learn and grow in my current role, and I'm truly grateful for the experiences I've gained there. However, I now feel ready to take on a new challenge that allows me to push my skill set further. I believe that change is essential for growth, and I'm looking for an environment where I can continue to evolve professionally and contribute in new, meaningful ways.

What are your strengths:

My strengths are teamwork and continuous learning. I enjoy working with others, sharing ideas, and supporting my team to achieve common goals.

What is your weakness:

My weakness is that I sometimes take on too much responsibility because I find it hard to say no. I also tend to trust people easily, which doesn't always work out.

Where do you see yourself in 5 years:

In 5 years, I see myself growing as a skilled frontend developer, taking on more responsibility, and contributing to larger projects. I want to keep learning new technologies and possibly lead a team to help deliver great software solutions.
